First Class ML & AI graduate and full-stack Software Engineer with 7+ years of industry experience, specialized in Go, Python, and C#. Proven track record of delivering high-concurrency microservices, deterministic game engines, automated data pipelines, and live-ops backend systems for world-class franchises.

PROFESSIONAL EXPERIENCE

TT Odyssey

Apr 2018 – Present

Work Experience: Apr 2018 – Apr 2018 | Intern: Aug 2018 – May 2019 | Junior: May 2019 – Nov 2021 | Part-Time: Nov 2021 – Sept 2022 | Standard: Oct 2023 – Present

- **Game Lead**: Perforce | Unreal Engine For Fortnite
  Led the development of a game at TT Odyssey, overseeing the design and implementation of core gameplay systems, coordinating with cross-functional teams, and ensuring the delivery of a high-quality player experience.
- **Game Of Thrones: Dragonfire**: Unity | C# | Go | gRPC | AWS | Git | SQL | Docker
  Contracted to WB Games Boston, shipping the game and supporting it through live operations. Designed and built the army builder screen and dragon pit in the Unity client, then owned the combat service: a deterministic simulation written in Go, run as an AWS microservice with Docker and Kubernetes. Managed the handover of the combat service to the Boston team.
- **Game Of Thrones: Conquest**: Unity | C# | Go | gRPC | AWS | Git | SQL | Docker
  Contracted to WB Games Boston to support live operations on a live mobile title, working on backend Go microservices (gRPC, Docker, SQL, AWS).
- **LEGO® Star Wars™ Battles**: Unity | C# | .Net | SQL | Python | AWS | Git | HTML | Objective C | Java | Docker
  Shipped as both free-to-play and on Apple Arcade, and supported through live operations. Designed, led and managed a dynamic learning-AI system that curated the early-game experience: server-side statistical models matched each AI's skill to the player, and each AI adapted its behaviour during the match based on the opponent's choices, measured through retention, win rates and player learning. Led all audio, using FMOD with custom Unity audio work, coordinating 2 audio designers and 3 stakeholders through LEGO and Lucasfilm sign-off and implementing it in code.
- **Economy Simulation Tools**: Unity | C# | Git | Python
  Developed a suite of internal tools for simulating and analysing economies, enabling data-driven decision-making for game design and monetization strategies.
- **Project Prototyping**: Unity | C# | Git
  Rapid prototyping of game concepts and mechanics in small teams, producing playable prototypes and validating ideas using Unity and iterative design.
- **Graphics Course**: C++ | OpenGL | Git
  Completed a graphics and physics sandbox project in C++ and OpenGL, implementing rendering and simulation techniques for performance and correctness.
- **Product Scraper**: Go | Git
  Implemented a Golang based web scraper to extract product data and export CSV reports, improving data collection efficiency for product research.

English Tutor

Sept 2018 – Apr 2019

Maths Tutor

Mar 2020 – Jun 2021

Business Consulting

Oct 2022 – Jul 2023

SKILLS Python | Git | HTML | CSS | Java Script

EDUCATION

Bachelor of Science in Machine Learning and Artificial Intelligence

Oct 2020 – Sept 2023

SKILLS Java Script | HTML | CSS | SQL | Git | Docker | Google Cloud | C++ | Python | Latex | scikit-learn

First Class Honours

> Machine Learning and AI, highlighted by my DECAF project a custom ML framework for game agent creation. The degree combined advanced algorithm design, distributed data techniques, and cloud-native practices with applied projects in NLP, signal processing, and computer vision. Achievements include First Class marks across all core modules in software design, neural networks, and agile project management.

EPQ

Oct 2016 – Oct 2017

SKILLS Python | Git

Achieved 98%

> Independent research dissertation investigating multi-technique supervised machine learning, implementing experiments in Python and producing a formal written report.

PERSONAL PROJECTS

Agent Studio

Sept 2026 – Present

SKILLS Go | Docker | Java Script | HTML | CSS | Git

> Designed and built Agent Studio, a local-first LLM agent harness in Go that runs entirely on Ollama with no cloud dependencies. Implemented a streaming tool-calling agent loop with 15 permission-grouped tools, hybrid retrieval (BM25 and vector embeddings fused with Reciprocal Rank Fusion, plus AST-aware Go chunking), markdown skill and memory loading, persistent sessions, and an LLM-as-a-judge evaluation harness, served through a web chat UI with server-sent event streaming.

Food Finder

Aug 2024 – Feb 2026

SKILLS Go | Docker | Java Script | HTML | CSS | Git

> Built Food Finder, a Go web application that scrapes eight UK supermarkets with config-driven selectors and a rate-limited, cached scraper, then normalises around 6,700 listings using NLP stemming, regex unit parsing and a dependency-ordered tagging engine of 400+ composable rules. Calculates the cheapest shopping list per store from inventory and unit prices, generates recipe variants from available ingredients, and maps nearby stores via OpenRouteService. Covered by unit and benchmark tests and shipped as a Docker image through GitHub Actions.

Time Tracker

May 2026 – Jul 2026

SKILLS Rust | SQL | Java Script | HTML | CSS | Git

> Built a Windows time tracker in Rust with a Tauri GUI. A background process samples open windows, processes, audio, input and display layout through the Win32 API, then stores the data in SQLite using change-only snapshots, versioned migrations and retry with back-off. The GUI turns it into work-hour reports with idle detection, user-defined tagging rules and charts, plus a session replay that plays back window and mouse activity. Ships as a single executable built by GitHub Actions.

House Finder

Dec 2023 – Nov 2024

SKILLS Python | Java Script | HTML | CSS | Git

> Architected and built an aggregator to prioritise property listings by spatial, financial and subjective criteria with an interactive website and server-side processing.
