Software Engineer focused on distributed systems, Go, and cloud-native practices. Experienced in developing automated data utilities, CI/CD pipelines, and microservices with a strong emphasis on system performance and scalability.

PROFESSIONAL EXPERIENCE

TT Odyssey

Apr 2018 – Present

Work Experience: Apr 2018 – Apr 2018 | Intern: Aug 2018 – May 2019 | Junior: May 2019 – Nov 2021 | Part-Time: Nov 2021 – Sept 2022 | Standard: Oct 2023 – Present

- **LEGO® Star Wars™ Battles**: Contributed holistically across the entire technical stack for a commercially released AAA mobile title. Directed the AI architecture team to design deterministic, high-performance decision-making algorithms under strict real-time constraints. Led cross-functional technical integration for high-profile IP assets, managing memory-optimized data streaming and strict compliance with global licensing guidelines.
- **Project Prototyping**: Rapid prototyping of game concepts and mechanics in small teams, producing playable prototypes and validating ideas using Unity and iterative design.
- **Economy Simulation Tools**: Developed a suite of internal tools for simulating and analysing economies, enabling data-driven decision-making for game design and monetization strategies.
- **Game Of Thrones: Dragonfire**: Contract engineering for WB Games Boston on Game of Thrones Dragonfire, building microservices and gameplay features using Unity, C#, Golang, gRPC and AWS for live operations.
- **Game Of Thrones: Conquest**: Contract work on backend microservices and tooling for Game of Thrones Conquest, focusing on scalable services using Golang, gRPC, Docker, SQL and AWS.
- **Graphics Course**: Completed a graphics and physics sandbox project in C++ and OpenGL, implementing rendering and simulation techniques for performance and correctness.
- **Product Scraper**: Implemented a Golang based web scraper to extract product data and export CSV reports, improving data collection efficiency for product research.

English Tutor

Sept 2018 – Apr 2019

Maths Tutor

Mar 2020 – Jun 2021

Business Consulting

Oct 2022 – Jul 2023

EDUCATION

Bachelor of Science in Machine Learning and Artificial Intelligence

Oct 2020 – Sept 2023

🏆 *First Class Honours*

> Machine Learning and AI, highlighted by my DECAF project a custom ML framework for game agent creation. The degree combined advanced algorithm design, distributed data techniques, and cloud-native practices with applied projects in NLP, signal processing, and computer vision. Achievements include First Class marks across all core modules in software design, neural networks, and agile project management.

EPQ

Oct 2016 – Oct 2017

> Independent research dissertation investigating multi-technique supervised machine learning, implementing experiments in Python and producing a formal written report.

TECHNICAL SKILLS

Unity | C# | C++ | Python | Java Script | HTML | CSS | Blender | SQL | .Net | Git | Objective C | Java | Docker | Latex | Go | Rust | AWS | gRPC

PERSONAL PROJECTS

Agent Studio

Sept 2026 – Present

> Designed and built Agent Studio, a local-first LLM agent harness in Go that runs entirely on Ollama with no cloud dependencies. Implemented a streaming tool-calling agent loop with 15 permission-grouped tools, hybrid retrieval (BM25 and vector embeddings fused with Reciprocal Rank Fusion, plus AST-aware Go chunking), markdown skill and memory loading, persistent sessions, and an LLM-as-a-judge evaluation harness, served through a web chat UI with server-sent event streaming.

Food Finder

Aug 2024 – Feb 2026

> Built Food Finder, a Go web application that scrapes eight UK supermarkets with config-driven selectors and a rate-limited, cached scraper, then normalises around 6,700 listings using NLP stemming, regex unit parsing and a dependency-ordered tagging engine of 400+ composable rules. Calculates the cheapest shopping list per store from inventory and unit prices, generates recipe variants from available ingredients, and maps nearby stores via OpenRouteService. Covered by unit and benchmark tests and shipped as a Docker image through GitHub Actions.

Time Tracker

May 2026 – Jul 2026

> Built a Windows time tracker in Rust with a Tauri GUI. A background process samples open windows, processes, audio, input and display layout through the Win32 API, then stores the data in SQLite using change-only snapshots, versioned migrations and retry with back-off. The GUI turns it into work-hour reports with idle detection, user-defined tagging rules and charts, plus a session replay that plays back window and mouse activity. Ships as a single executable built by GitHub Actions.

House Finder

Dec 2023 – Nov 2024

> Architected and built an aggregator to prioritise property listings by spatial, financial and subjective criteria with an interactive website and server-side processing.
